

- Describe how you will go about learning this new information/skill.
- Explain how this will benefit your team
- Identify a target date by which you will report back to your team and demonstrate what you learned.

A skill that I want to continue developing and learning is CREO. I haven't used Creo of any other type of CAD package since freshman year so I am pretty rusty on my skills. Since we are beginning to enter the system level design phase, we are going to try to settle a system design by the end of the phase then begin moving into the detailed design phases. So it will be important to begin to work on a simple CAD model to begin to test out and narrow down ideas that turn out to be impractical once we see it in the CAD model. So I will be brushing up on my Creo skills, by trying to replicate and go through some of the old tutorials that we had completed in MECE 104 in order to remember and start expanding on some the skills as I continue to work through some other basic tutorials or attempt to make a simple system design model for the project. I will set my target date for the last week in October, (October 26th), to have completed this task. This will help out my team since I will be able to assist Gina with some of the CAD modeling and be able to offer suggestions on the different tools that can be used to model different aspects of the design.
